## THE ILLUSION OF PROTECTION

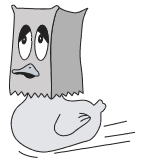

The greatest problem faced by users nowadays, is the incomprehensible slowing down of their systems. The computer is slower to react than when it was new – sometimes significantly slower – it may freeze up or accessing files may be difficult or impossible. In almost all of these cases we can presume that viruses or spyware have infiltrated the computer. **Frequently, dozens of viruses and spyware can be found on computers that either don't have antivirus protection or where protection has not been updated.** This makes it impossible for the computer to function properly and the risk of losing valuable data is greater.

**Many people wrongly believe that their data is safe because the computer either contained antivirus software** when purchased or because they've installed an antivirus themselves. In fact, even with antivirus software, we're not really protected unless the antivirus is updated at least once per week. New viruses appear frequently and the software must be notified in order to repel or delete them.

Antivirus software is essential from the moment that the Internet is used because viruses can access your computer through email, downloaded files, messaging software, etc. In addition, you must also use a firewall to prevent intruders from accessing your computer while online. **Users must understand that connecting to the Internet is like being networked with millions of people – some of whom are less than trustworthy.** There are people who will take advantage of the situation by infiltrating computers and stealing files, personal information, and email addresses. An intruder can even use someone else's computer to transmit unsolicited email or spam to others. For all of these reasons, users must purchase a firewall, configure it properly and update it on a regular basis. Users who are permanently online, such as those with high-speed Internet, are at even greater risk than other users.

Don't hesitate to contact us if you require assistance in protecting your computer.

## Discover OPTOSYS<sup>2</sup>.com

**This month discover the Visits tab in the Patient File (see the reverse).**

This tab is divided into 3 sections. The first section allows you to view all of the selected patient's appointments, along with their status. It is possible to configure the appointments so that a Visit is automatically generated when the status is changed to "Arrived".

The second section allows you to view the patient's Visit History. It is also possible to configure the visits to automatically generate a recall date.

The last section allows you to view all the recalls made, and can be used to follow-up on recalls.

You can also sort or export the information in the grids (see the March 2005 edition of Optosys Info).

Look for future editions of Optosys Info to learn more about the remaining tabs.
